- 4 Conclusion

History of StreamHash Family

Jan 2007 NIST published draft of requirements for the SHA-3 competition

Nov 2007 NIST requested submissions for new hash functions

Oct 2008 StreamHash function submitted for the SHA-3 competition

Dec 2008 StreamHash function published by NIST

Dec 2008 Published attacks against StreamHash function

2009-2010 Working on the successor – StreamHash2

History of StreamHash Family

Jan 2007 NIST published draft of requirements for the SHA-3 competition

Nov 2007 NIST requested submissions for new hash functions

Oct 2008 StreamHash function submitted for the SHA-3 competition

Dec 2008 StreamHash function published by NIST

Dec 2008 Published attacks against StreamHash function

2009-2010 Working on the successor – StreamHash2

History of StreamHash Family

Preimage Attack

- Dmitry Khovratovich and Ivica Nikolić, University of Luxembourg
- Multicollision Attack (Antoine Joux: Multicollisions in Iterated Hash Functions, CRYPTO 2004)
 - Complexity of $\frac{n}{2} \cdot 2^{n/4}$ for finding collisions
 - Complexity of $\frac{n}{2} \cdot 2^{n/2}$ for finding preimages
- Issue addressed in StreamHash2 by introducing a counter

Preimage Attack

 - Complexity of $\frac{n}{2} \cdot 2^{n/4}$ for finding collisions
 - Complexity of $\frac{n}{2} \cdot 2^{n/2}$ for finding preimages
- Issue addressed in StreamHash2 by introducing a counter

Collision Attack

- Tor E. Bjørstad, Department of Informatics, University of Bergen, Norway
- Internal state cycles
- The \oplus operation of StreamHash did not propagate changes between the four bytes of the 32-byte state word
- Issue addressed by replacing \oplus operation with \boxplus

Collision Attack

- Tor E. Bjørstad, Department of Informatics, University of Bergen, Norway
- Internal state cycles
- The \oplus operation of StreamHash did not propagate changes between the four bytes of the 32-byte state word
- Issue addressed by replacing \oplus operation with \boxplus

Functional Requirements

Hash function $h(m)$ is expected to meet the following requirements

- Input m can be of any length
- Output of $h(m)$ has a predefined, fixed length
- $h(m)$ is fast to compute for any given m

Functional Requirements

Hash function $h(m)$ is expected to meet the following requirements

- Input m can be of any length
- Output of $h(m)$ has a predefined, fixed length
- $h(m)$ is fast to compute for any given m

Functional Requirements

Hash function $h(m)$ is expected to meet the following requirements

- Input m can be of any length
- Output of $h(m)$ has a predefined, fixed length
- $h(m)$ is fast to compute for any given m

Security Requirements

- **Preimage resistance**

Practically infeasible for any given $h(m)$ to compute m

- **Second preimage resistance**

Practically infeasible for any given m_1 message it is infeasible to find another m_2 such that $h(m_1) = h(m_2)$

- **Collision resistance**

Practically infeasible to find two different messages m_1 and m_2 such that $h(m_1) = h(m_2)$

Security Requirements

- **Preimage resistance**

Practically infeasible for any given $h(m)$ to compute m

- **Second preimage resistance**

Practically infeasible for any given m_1 message it is infeasible to find another m_2 such that $h(m_1) = h(m_2)$

- **Collision resistance**

Practically infeasible to find two different messages m_1 and m_2 such that $h(m_1) = h(m_2)$

State Vector

State vector consists of 32-bit words

- $7 \times 32 = 224$ bits
- $8 \times 32 = 256$ bits
- $12 \times 32 = 384$ bits
- $16 \times 32 = 512$ bits

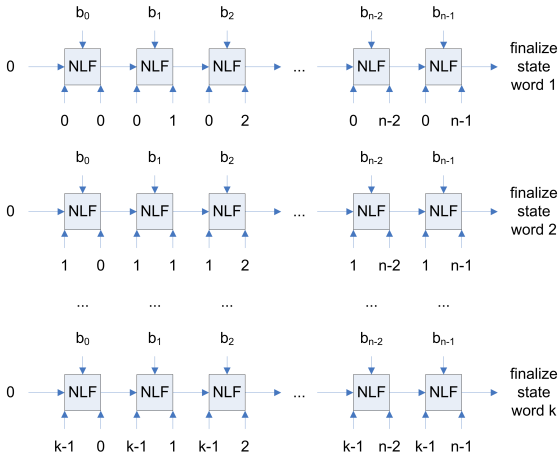

NLF Transformation

NLF is a non-linear transformation based on an S-BOX

StreamHash Family Structure

NLF Implementation of StreamHash2 Function

$$state_{i+1} \leftarrow state_i \boxplus S\text{-BOX}[LSB(state_i) \oplus b \oplus i] \boxplus c$$

, where:

b processed byte value

c processed byte index

i state vector index

S-BOX S-BOX table

state state vector

Streamhash2 Advantages – Simplicity

- Clear and easy to analyze design
- Minimal size of code
- Minimal size of variables
- Low size of static data
- Flexible hash value length

Streamhash2 Advantages – Simplicity

- Clear and easy to analyze design

Streamhash2 Advantages – Simplicity

- Clear and easy to analyze design
- Minimal size of code
- Minimal size of variables
- Low size of static data
- Flexible hash value length

Streamhash2 Advantages – Performance

- Easy to parallelize internal structure
- Negligible performance impact of machine endianness
- High performance on 8-bit and 16-bit architectures
- Low latency
- High throughput for short messages

Streamhash2 Advantages – Performance

- Easy to parallelize internal structure
- Negligible performance impact of machine endianness
- High performance on 8-bit and 16-bit architectures
- Low latency
- High throughput for short messages

Streamhash2 Advantages – Performance

- Easy to parallelize internal structure
- Negligible performance impact of machine endianness
- High performance on 8-bit and 16-bit architectures
- Low latency

Streamhash2 Advantages – Performance

- Easy to parallelize internal structure
- Negligible performance impact of machine endianness
- High performance on 8-bit and 16-bit architectures
- Low latency
- High throughput for short messages

Streamhash2 Advantages – Performance

- Easy to parallelize internal structure
- Negligible performance impact of machine endianness
- High performance on 8-bit and 16-bit architectures
- Low latency
- High throughput for short messages

StreamHash2 Disadvantages

- Expensive hardware implementation
- Side-channel attacks on S-BOX lookups
- Mathematical background not well studied in cryptographic applications

StreamHash2 Disadvantages

- Expensive hardware implementation
- Side-channel attacks on S-BOX lookups
- Mathematical background not well studied in cryptographic applications

StreamHash2 Disadvantages

- Expensive hardware implementation
- Side-channel attacks on S-BOX lookups
- Mathematical background not well studied in cryptographic applications

Conclusion

- A new family of cryptographic hash functions was proposed
- Security properties of this new family require some further analysis

Conclusion

- A new family of cryptographic hash functions was proposed
- Security properties of this new family require some further analysis
